

A plurality of inks of different densities are used to obtain a halftone image with controlled graininess. An ink which has low penetrability on a recording medium and which controls the diffusion of dots is used as an ink with a relatively high density. An ink which has high penetrability and which permits easy diffusion of dots is used as an ink with a relatively low density. The present invention also provides a characteristic recorded article to be formed by a plurality of dots having different penetrabilities on a recording medium.

Among a plurality of inks with different densities, the inks of the same color category are grouped and held in an ink container and are divided in the container by the ink density. This configuration makes it possible to make the containers smaller and minimize the number of containers.--

IN THE CLAIMS:

Please amend claims 1, 14, 21 and 30 as follows:

1. (Amended) An ink-jet recording apparatus for forming an image on a recording medium by using a plurality of ink discharge means which discharge inks;

said plural ink discharge means corresponding to a plurality of inks with different dye densities in inks, wherein the penetrability of inks having different dye density is different from each other and ink having low dye density among a plurality of inks of different dye is ink having
